

AI OPERATIONS PLATFORM

Operational intelligence for modern warehouse & terminal environments

Terminalhubben is an AI Operations Platform that unites operational execution with management decision support — an ecosystem of AI agents, real-time data and a command center in one cohesive environment.

One platform, **two environments**

Terminalhubben is split into two layers — one for operational execution on the floor and one for operational intelligence and decision support in management.

Galaxy Workspace

OPERATOR ENVIRONMENT

Purpose — operational execution in daily operations.

■ Galaxy AI

Voice- and text-driven operational assistance.

■ Scanner AI

AI-assisted scanning and pick support.

■ Operations Info

Real-time messages and exceptions.

■ Productivity

Pick rounds, statistics and performance.

■ Group Communication

Group chat, polls and images.

■ Outbound Operations

Outbound loading, check digits and departures.

Galaxy Enterprise

MANAGEMENT ENVIRONMENT

Purpose — operational intelligence and decision support.

■ Enterprise Command Center

Operational overview and real-time monitoring.

■ Driftledare AI

Operations intelligence and risk identification.

■ WMS Expert AI

Process and configuration specialist.

■ Productivity Analyst AI

Performance and bottleneck analysis.

An ecosystem of specialized AI agents

Each agent is a focused operational specialist — orchestrated together they form the platform's intelligence core.

AI AGENTS · TERMINALHUBBEN AB

ORCHESTRATION: ACTIVE

Galaxy AI

● Online

WAREHOUSE COPILOT

Specialization	Operational assistance
Interface	Voice & text
Modell	GPT-4o

The operational copilot on the floor — answers questions, retrieves data and guides through tasks in real time.

Driftledare AI

● Aktiv

OPERATIONS
INTELLIGENCE AGENT

Specialization	Warehouse operations & logistics
Language	Swedish (primary)
Modell	GPT-4o

Analyzes productivity and KPIs, identifies operational risks and proposes optimizations for picking and flows.

WMS Expert AI

● Aktiv

PROCESS &
CONFIGURATION
SPECIALIST

Specialization	WMS processes
Domain	Configuration & flows
Modell	GPT-4o

Expert in the warehouse management system's processes and configuration — translates business needs into system settings.

Productivity Analyst AI

● Online

OPERATIONAL
PERFORMANCE
INTELLIGENCE

Specialization	Performance & bottlenecks
Window	Last 7 days
Engine	AI Engine

Monitors operational performance, identifies bottlenecks from pick comments and generates recommended actions.

Galaxy Driftledare – agent profile in the Enterprise Command Center

ENTERPRISE COMMAND CENTER

All operations in one view

The Command Center brings real-time status, AI-generated insights and agent orchestration into one interface built for management decisions.

- ✓ **Operational overview** — operators, pick rounds, trucks, outbound loads and exceptions in real time.
- ✓ **AI-generated insights** — automatic operations reports and recommendations.
- ✓ **Real-time monitoring** — System Health and status for every subsystem.

- ✓ **Agent orchestration** — Galaxy AI and specialist agents coordinated in one place.
- ✓ **Decision support for management** — from operational signal to strategic decision.

LATEST INSIGHTS

- ✓ Bottleneck risk in outbound — sector C.
- ✓ Capacity utilization rising in zone C (91%).
- ✓ Staff efficiency 7% above target today.

From operational activity to executive decisions

Every pick round becomes data, every voice comment becomes a signal — and every signal becomes decision input. This is how intelligence flows through the platform.

- 01 Warehouse Activity** Picking, trucks and outbound in operation.
- 02 Productivity Metrics** Lines, rounds and pace are recorded.
- 03 Voice Feedback** Operator voice comments are captured.
- 04 AI Analysis** Agents interpret data and feedback.
- 05 Bottleneck Detection** Bottlenecks and risks are identified.
- 06 Recommendations** Concrete action proposals are generated.
- 07 Management Decisions** Management acts on factual evidence.

The screenshot displays the 'Enterprise Productivity Intelligence' dashboard. The interface includes a top navigation bar with a search function and system health indicators (98.7% SYSTEM HEALTH). The left sidebar shows a menu with 'TERMINALHUBBEN', 'Alla system aktiva', 'Warehouse Activity', 'Mission Control', and 'INTELLIGENCE' with sub-items 'Productivity Intelligence', 'Analytics', and 'Forecasting'. The main content area is divided into several panels:

- AI Feedback-analys**: A panel with a 'GPT-ANALYS' button and an 'Uppdatera' button. It contains the text: 'Analys kunde inte genomföras. Kontrollera att det finns feedback-data.'
- Flaskhals-detektion**: A panel with an 'AI ENGINE' button. It contains the text: 'Flaskhals-analys kunde inte genomföras.'
- Productivity Analyst AI**: A panel with an 'ONLINE' status. It includes a section for 'Analyserar senaste 7 dagarna' and two main sections:
 - **Produktivitetsstatus****: A text block stating that productivity has been stable over the last week, with an average performance of 189.5 lines per hour. It mentions that an operator has picked a total of 4 lines, indicating a low activity level, and that only 2 rounds have been completed. It also notes a positive feedback from the operator, suggesting a good working environment.
 - **Identifierade utmaningar****: A list of challenges:
 - Låg mängd plockade rader (endast 4 rader idag).
 - Endast en aktiv operatör, vilket begränsar kapaciteten.
 - Ingen registrerad AI-taggnings av problem, vilket kan indikera brist på insamlad data för att identifiera potentiella förbättringsområden.
 - **Rekommenderade åtgärder****: A section for recommendations, with a prompt to 'Ställ en specifik fråga till Productivity Analyst' and a text input field containing 'T.ex. "Vilken zon har flest problem?"' and a submit button.

The bottom of the dashboard features a 'GALAXY AI' status bar with 'Online' status, a summary of '8 Aktiva analyser', '3 Rekommendationer', and '1 Kritisk varning', and a button to 'Öppna AI Command Center --'. The user profile 'Robin SUPERADMIN' is visible in the bottom right corner.

● GALAXY WORKSPACE

The operator environment in action

Real views from the operator app — where the platform's intelligence meets the floor.

Home

Modules for picking, performance, operations info and Galaxy AI.

Galaxy Pick

Voice-controlled calculator that totals the pick round.

Operations Info

Real-time messages with voice notification.

Performance Data

AI analysis that identifies bottlenecks.

Group Communication

Polls and scheduling questions in real time.

ENTERPRISE ARCHITECTURE

A complete operational intelligence ecosystem

Terminalhubben is built in six connected layers — from the operator experience to the cloud platform — orchestrated around an ecosystem of AI agents.

Layer 01 · Experience

Galaxy Workspace

Operational execution in daily operations.

Voice-first workflows

Mobile-first experience

Progressive Web App

Real-time communication

Operator productivity

TECH

React

TypeScript

PWA

Layer 02 · Enterprise

Galaxy Enterprise

Operational intelligence and management
— executive-focused.

● INTEGRATIONS

Connects to your **existing IT environment**

Terminalhubben is no isolated island — it connects to the infrastructure a modern logistics organization already runs.

WAREHOUSE MANAGEMENT

WMS

Real-time data on stock status, locations and picking.

BUSINESS SYSTEMS

ERP

Orders, items and financial flows.

INTERFACES

REST APIs

Secure data exchange in both directions.

CLOUD

Azure AI Services

AI, speech and cognitive functions.

IDENTITY & TOOLS

Microsoft 365

Seamless connection in a Microsoft environment.

EXTENSIBLE

Third-party systems

Connect more tools as needed.

Business value — value in operations and management

01

More efficient information flows

The right information reaches the right person without detours.

02

Reduced training time

Guidance right in the work shortens time to productivity.

03

Higher productivity

More time on value-creating work.

04

Better decision support

AI insights and analyses on demand.

05

Faster onboarding

Tacit knowledge made searchable and accessible.

06

Round-the-clock operational intelligence

Agents that monitor and analyze continuously.

● FOUNDER & ARCHITECTURE

Built by a platform architect

Robin Agberg

Founder · System Architect · AI Platform Engineer

Terminalhubben is architected and built as a cohesive AI Operations Platform — from the Galaxy Workspace operator environment to the Galaxy Enterprise management environment and its ecosystem of AI agents. Platform design, system architecture, full-stack development and AI integration are driven with the ambition of a product company, not as a single project.

A premium enterprise platform for operational intelligence

Terminalhubben unites system architecture, AI agents and decision support in one platform, ready to present to decision-makers and partners.
